(54) OXIDE ION CONDUCTIVE BODY AND SOLID FUEL CELL

(57)Abstract:

PURPOSE: To obtain an oxide ion conductive body having high ion conductivity and high mechanical strength against heat cycle by adding Sc as a main dopant and Al as a sub dopant in a specific range.

CONSTITUTION: A raw material is prepared to mix in accordance with a chemical composition expressed by a formula (1-x-y)ZrO2xSc2O3−yAl2O3 (where, 0.07≤(x+y)≤0.13 and 0.005≤y≤0.02), is molded into a pellet having a prescribed size and is fired in air at about 1620° C for about 60 hours to form the oxygen ion conductive body. The oxygen conductive body contains Sc as the main dopant. Since the ion radius of Sc is closer to that of Zr, the oxide ion easily moves then Y2O3 stabilized ZrO2 (YSZ), extremely large ion conductivity is attained at a lower temp, compared with YSZ. And Al stable in trivalent is added as the sub dopant. As a result, the ion conductivity keeps almost the property of Sc and the crystal structure stable in hexagonal system does not exhibit crystal transformation.

(54) 【発明の名称 】 酸素イオン導伝体及び固体燃料電池

(57)【要約】

【目的】 本発明は、YSZに比べてイオン伝導度が高 く、室温と動作温度の間での構造変態がなく、さらに、 燃料電池の固体電解質としても実用上使用可能な酸素イ オン導伝体及び固体燃料電池を提供することを目的とす る。

【構成】 本発明は、(1-x-y) Z r O₂-x S c₂ 〇3 - y A 12 O3 なる組成物よりなることを特徴とす る。

【特許請求の範囲】

【請求項1】 (1-x-y) $Z r O_2-x S c_2 O_3-y A l_2 O_3$ なる組成物よりなることを特徴とする酸素イオン導伝体。

【請求項2】 (1-x-y) Z r O_2-x S C_2 O_3-y A I_2 O_3 $(0.07 \le x+y \le 0.13$ かつ0.00 $5 \le y \le 0.02$) なる組成物よりなることを特徴とする請求項1 に記載の酸素イオン導伝体。

【請求項3】 (1-x-y) ZrO₂-xSC₂O₃yAl₂O₃なる組成を有する酸素イオン導伝体を固体電 10 解質として用いたことを特徴とする固体燃料電池。

【請求項4】 (1-x-y) $Z r O_2-x S c_2 O_3-y A 1_2 O_3$ $(0.07 \le x+y \le 0.13 かつ0.00$ $5 \le y \le 0.02$ なる組成を有する酸素イオン導伝体を固体電解質として用いたことを特徴とする請求項3に記載の固体燃料電池。

【発明の詳細な説明】

[0001]

【産業上の利用分野】本発明は、酸素イオン導伝体及び 固体燃料電池に関するものである。

[0002]

【従来の技術】近年、酸素イオン導伝体を用いた固体電解質燃料電池に関心が高まりつつある。特にエネルギーの有効利用という観点から、固体燃料電池はカルノー効率の制約を受けない本質的に高いエネルギー変換効率を有し、さらに良好な環境保全が期待されるなどの優れた特長を持っている。

【0003】固体電解質燃料電池の電解質として従来最も有望視されてきた酸素イオン導伝体である Y_2O_3 安定化 ZrO_2 (YSZ)において十分なイオン伝導度を得るには1000 ∞ の高温動作が必要である。

【0004】しかし、このような高温では電極界面との 反応による部品寿命の劣化が激しく、そのため固体燃料 電池の実用化がおくれているのが現状である。このよう な観点から動作温度を下げることが望まれそのため Y S Z より高いイオン伝導度のイオン導伝材料の出現が望まれている。

【0005】一般にジルコニア系の酸素イオン導伝体ではドーパントのイオン半径が小さくなるほどイオン伝導度が上昇する傾向がある。これはドーパントのイオン半 40径が Zr^{+} のイオン半径に近づくと、動きうる酸素イオンの活性化エネルギーが小さくなるためである。事実、 $ZrO_2-Sc_2O_3$ 系はジルコニア系で最も高いイオン伝導度を有することが知られている。

【0006】しかし、ドーパントの増加とともに結晶構造は単斜晶ー菱面体一立方晶へと変化し、またイオン伝導度が最大の値をとる領域では菱面体が室温で安定となり、立方晶が安定化されない。さらに650℃以上では立方晶に構造相転移するため熱サイクルによる破壊を引き起こし固体電解質材料として使用することは実用上不50

可能となる。

[0007]

【発明が解決しようとする課題】本発明はYSZに比べてイオン伝導度が高く、室温と動作温度の間での構造変態がなく、さらに、燃料電池の固体電解質としても実用上使用可能な酸素イオン導伝体及び固体燃料電池を提供することを目的とする。

[0008]

【課題を解決するための手段】本発明の酸素イオン導伝体は、(1-x-y) Z r O_2-x S C_2 O_3-y A I_2 O 3 なる組成よりなることを特徴とする。

【0009】また、本発明の固体燃料電池は、(1-x-y) $ZrO_2-xSc_2O_3-yAl_2O_3$ なる組成よりなる酸素イオン導伝体を固体電解質として用いたことを特徴とする。

【0010】尚、上記のような酸素イオン導伝体は通常の固相反応による焼結法で得られる。

[0011]

【作用】以下に本発明の作用を本発明をなすに際して得た知見とともに説明する。

【0012】本発明者は、まず、 $ZrO_2-Sc_2O_3$ 系のイオン導伝体を固体電解質として燃料電池に用いた場合になぜに電極との間での剥離が生ずるかの原因の解明を行った。その結果、剥離は次のような理由によって生ずるのであろうとの知見を得た。

【0013】すなわち、ドーパントの増加とともに結晶構造は単斜晶一菱面体一立方晶と変化し、またイオン伝導度が最大の値をとる領域では菱面体が室温で安定となり立方晶が安定化されない。さらに650℃以上では立方晶に構造変化するため、熱膨張率の相違に基づき、熱サイクルによる破壊(剥離)を引き起こすものであると考えられる。

【0014】そこで、本発明者は、かかる相変態を防止するための手段を求めるべく、幾多の実験を重ね創意探求した。ただ、注意を要した点は、相変態を防止するだけでは不十分であり、相変態を防止し得るとともに、YSZよりも高いイオン伝導度を保持せしめなければならないということである。

【0015】また、幾多の実験を重ねる過程において、本発明者はScの他に副ドーパントを添加すると安定した相構造が得られ、また、高いイオン伝導度を示す場合があることを見いだした。

【0016】そこで、さらに実験を重ねたところ、Scの一部を3価が安定なAlで置換すると立方晶構造が安定して得られることを知見した。

【0017】さらに、主ドーパントであるScと副ドーパントの合計含有量が一つの要因をなしており、ある限定された範囲内における添加量とすると、より一層高い伝導度を得る上で好ましいことを解明した。

【0018】本発明では、(1-x-y) ZrO₂-x

2

 $Sc_2O_3-yAl_2O_3$ なる組成よりなる材料を用いる。 【0019】すなわち、本発明によって得られる酸素イオン導伝体は、主ドーパントとしてScを含有する。Scのイオン半径はZrに近いためYSZより酸素イオンが動きやすい。このためYSZに比べて低温で著しく大きなイオン伝導度を実現できる。

【0020】また、本発明では、3価が安定なA1を副ドーパントとして添加する。かかる副ドーパントによりイオン伝導度はほぼScの特性を保持し、なおかつ、結晶構造は立方晶に安定化され高温での結晶変態は現われ 10ない。この場合A1203は一般的な焼結助材としてではなく結晶変態の抑制として働いている。

【0021】さらに、本発明では、 $0.07 \le x + y \le 0.13$ かつ $0.005 \le y \le 0.02$ とする。かかる限定された範囲における添加量とすれば、相変態がなく、より一層高いイオン伝導度を有する酸素イオン導伝体が得られる。

【0022】また本発明者は、本発明の $ZrO_2 - Sc_2O_3 - Al_2O_3$ 系の焼結体を作製するに際し、焼結助材として、 SiO_2 を少量添加した場合にもイオン伝導度はわずかに減少するものの、その相対効果は変わらないことも解明した。

【0023】以上のような構成とすることによって、高イオン伝導度かつ熱サイクルに対する機械的強度の強い (例えば、電極との剥離が生じない)材料を実現できる。

[0024]

【実施例】以下に本発明の実施例を説明する。なお、当 然のことであるが本発明は以下の実施例に限定されるも のではない。

DETAILED DESCRIPTION

[Detailed Description of the Invention]

T00011

[Industrial Application] This invention relates to an oxygen ionic conductor and a solid fuel cell.

[0002]

[Description of the Prior Art] In recent years, an interest is increasing in the solid electrolyte fuel cell using an oxygen ionic conductor. From a viewpoint especially of a deployment of energy, the solid fuel cell has the features which do not receive constraint of the Carnot efficiency and which were [expect / essentially have a high energy conversion efficiency and / still better environmental preservation] excellent.

[0003] 1000-degree C elevated-temperature actuation is required to obtain sufficient ionic conductivity in the 2OY3 stabilization ZrO2 (YSZ) which is the oxygen ionic conductor by which promising ** has been conventionally carried

out most as an electrolyte of a solid electrolyte fuel cell.

[0004] However, at such an elevated temperature, degradation of the components life by the reaction with an electrode interface is intense, therefore the present condition is that utilization of a solid fuel cell is behind. To lower operating temperature from such a viewpoint is desired, therefore an appearance of the ion **** ingredient of ionic conductivity higher than YSZ is desired.

[0005] Generally, by the oxygen ionic conductor of a zirconia system, there is an inclination for ionic conductivity to go up, so that the ionic radius of a dopant becomes small. This is because the activation energy of the oxygen ion which can move becomes small, when the ionic radius of a dopant approaches the ionic radius of Zr4+. In fact, it is known

that 2OZrO2-Sc3 system has the highest ionic conductivity by the zirconia system.

[0006] However, with the increment in a dopant, in the field in which the crystal structure changes to a monoclinic system-rhombohedron-cubic, and ionic conductivity takes the greatest value, rhombohedron becomes stable at a room temperature, and a cubic is not stabilized. Above 650 more degrees C, it becomes practically impossible to cause destruction by the heat cycle, in order to carry out tectofacies transition at a cubic, and to use it as a solid electrolyte ingredient.

[0007]

[Problem(s) to be Solved by the Invention] this invention -- YSZ -- a ratio -- BE ** ionic conductivity is high, there is no structure transformation between a room temperature and operating temperature, and it aims at offering the practically still more nearly usable oxygen ionic conductor also as a solid electrolyte of a fuel cell, and a solid fuel cell. [0008]

[Means for Solving the Problem] The oxygen ionic conductor of this invention is ZrO(1-x-y)2-xSc2O3-yAl 2O3. It is

characterized by consisting of a presentation.

[0009] Moreover, the solid fuel cell of this invention is characterized by using the oxygen ionic conductor which consists of a presentation which becomes ZrO(1-x-y)2-xSc2O3-yAl2O3 as a solid electrolyte.

[0010] In addition, the above oxygen ionic conductors are obtained with the sintering process by the usual solid phase reaction.

[0011]

[Function] It explains with the knowledge which obtained [acting this invention and] this invention on the occasion of the following.

[0012] this invention person solved the cause of in why exfoliation between electrodes arises, when it was first used for a fuel cell, having used the ionic conductor of 2OZrO2-Sc3 system as the solid electrolyte. Consequently, exfoliation acquired knowledge that it will be generated for the following reasons.

[0013] That is, with the increment in a dopant, in the field in which the crystal structure changes with a monoclinic

system-rhombohedron-cubic, and ionic conductivity takes the greatest value, rhombohedron becomes stable at a room temperature and a cubic is not stabilized. Above 650 more degrees C, in order to change structurally to a cubic, based on a difference of coefficient of thermal expansion, it is thought that it is what causes the destruction (exfoliation) by the heat cycle.

[0014] Then, many experiments were repeated and this invention person did the original idea pursuit so that he may search for the means for preventing this phase transformation. However, I hear that it must make ionic conductivity higher than YSZ hold, and there is while it is inadequate just to prevent a phase transformation as for the point of having required cautions and it can prevent a phase transformation.

[0015] Moreover, in the process in which many experiments are repeated, it found out that the phase structure stabilized when the subdopant other than Sc was added is acquired, and this invention person may show high ionic conductivity.

[0016] Then, when the experiment was repeated further, and a part of Sc was permuted with aluminum with trivalent [stable], the knowledge of cubic structure being stabilized and being acquired was carried out.

[0017] Furthermore, the desirable thing was solved when Sc which is the main dopant, and the factor whose sum total content of a subdopant is one are made, and it was an addition within a certain limited limits, and obtaining still higher conductivity.

[0018] In this invention, the ingredient which consists of a presentation which becomes ZrO(1-x-y)2-xSc2O3-yAl2O3 is used.

[0019] That is, the oxygen ionic conductor obtained by this invention contains Sc as a main dopant. Since the ionic radius of Sc is close to Zr, it is easy to move oxygen ion from YSZ. for this reason, YSZ -- a ratio -- remarkable big ionic conductivity is realizable by BE ******.

[0020] Moreover, in this invention, aluminum with trivalent [stable] is added as a subdopant. this subdopant -- ionic conductivity -- almost -- the property of Sc -- holding -- in addition -- and the crystal structure is stabilized by the cubic and the crystal transformation in an elevated temperature does not appear. In this case, aluminum 2O3 is working as control of a crystal transformation as general sintering assistant **.

[0021] Furthermore, it is referred to as $0.07 \le x+y \le 0.13$ and $0.005 \le y \le 0.02$ in this invention. There are no addition, then phase transformation in this limited range, and the oxygen ionic conductor which has still higher ionic conductivity is obtained.

[0022] Moreover, although ionic conductivity decreased slightly also when this invention person faced producing the sintered compact of 2OZrO2-Sc2O3-aluminum3 system of this invention and little addition of SiO2 was carried out as sintering assistant **, not changing also solved the relative effectiveness.

[0023] By considering as the above configurations, the strong (for example, exfoliation with an electrode does not arise) ingredient of high ionic conductivity and the mechanical strength to a heat cycle is realizable.

[0024]

[Example] The example of this invention is explained below. In addition, although it is natural, this invention is not limited to the following examples.

[0025] (Example 1)

(1-x-y) After blending ZrO2-xSc2O3-yAl 2O3 (0<x+y0 <0.16 and x>0, y>) with the chemical composition shown in Table 1, it mixed enough, baking was performed for what was cast to ** let with a 20mmphi thickness of 2mm at the temperature of 1620 degrees C for 60 hours in air, and the ionic conductor was produced. After identifying the generation phase of a sample by the powder X diffraction and carrying out the sweep of the ionic conductivity on the frequency of 10Hz - 1MHz with an impedance meter, it measured by performing an impedance plot.

[0026] The X-ray diffraction pattern in the room temperature in the case of 0.88ZrO(s)2-0.115Sc2O3-0.005aluminum 2O3 is shown in drawing 1 (drawing 1 (a)). In addition, also in 0.88ZrO(s)2-0.12Sc 2O3 which does not contain a subdopant, it is shown (drawing 1 (b)). When a dopant is not included, at a room temperature, a rhombohedron phase is obtained as a single phase. However, if temperature is raised, it will transfer to a cubic near 650 degree C. However, it turns out that the cubic is stabilized by addition of a subdopant.

[0027] The temperature dependence of ionic conductivity is shown in <u>drawing 2</u>. At 0.88ZrO(s)2-0.12Sc 2O3 which has not added aluminum 2O3, it is the crystal structure. In connection with phase transition, ionic conductivity changes nonsequetially near transition temperature (<u>drawing 2</u>(b)). Ionic conductivity is mostly satisfied with 0.88ZrO2-0.115Sc2O3-0.005A 1 2O3 which added aluminum 2O3 of the relation of almost linear ARERIUSU (<u>drawing 2</u>(a)). Even when aluminum 2O3 is doped, the outstanding ion conductivity is indicated to be 8.9xl0-2ohm-1 cm-1 at 800 degrees C.

[0028] The result of 800 degrees C [which was measured like the following] ionic conductivity is shown in Table 1.

The ionic conductivity higher than value 2x10-2 of YSZ in 800 degrees C in any case was shown, and, as for the crystal structure, the cubic was stabilized to the room temperature.

[0029] In addition, although ionic conductivity decreases slightly also when little addition of SiO2 is carried out as sintering assistant **, the relative effectiveness does not change.

Table 1 Ingredient Conductivity (ohm-1cm-1)

- 0. 88ZrO2-0.115Sc2O3-0.005Aluminum 2O3 8.8x10-20.88ZrO2-0.10Sc2O3-0.02aluminum 2O3 7.1x10-20.88ZrO2-0.08Sc2O3-0.04aluminum 2O3 6.2x10-20.88ZrO2-0.06Sc2O3-0.06aluminum 2O3 5.1x10-20.88ZrO2-0.04Sc2O3-0.06aluminum 2O3 5.1x10-20.88ZrO2-0.06aluminum 2

- (1-x-y) After blending ZrO2-xSc2O3-yAl 2O3 (0.07 <=x+y<=0.13 and 0.005<=y<=0.02) with the chemical composition shown in Table 4, it mixed enough, baking was performed for what was cast to ** let with a 20mmphi thickness of 2mm at the temperature of 1620 degrees C for 60 hours in air, and the ionic conductor was produced. After identifying the generation phase of a sample by the powder X diffraction and carrying out the sweep of the ionic conductivity on the frequency of 10Hz 1MHz with an impedance meter, it measured by performing an impedance plot.
- [0038] As for the crystal structure, a rhombohedron phase did not appear by the subdopant aluminum 2O3, but the cubic was stabilized to the room temperature. The result of 800 degrees C [which was measured like the example 1] ionic conductivity is shown in Table 4. $0.07 \le x+y \le 0.13$ showed the high ionic conductivity of 3 times from the value 2x10-2 of YSZ in 800 degrees C.
- [0039] In addition, although ionic conductivity decreases slightly also when little addition of SiO2 is carried out as sintering assistant **, the relative effectiveness does not change.
- table 4 An ingredient Conductivity (ohm-1cm-1) 0.93ZrO2-0.065Sc2O3-0.005aluminum 2O3 6.8x10-20.92ZrO2-0.075Sc2O3-0.005aluminum 2O3 7.5x10-20.91ZrO2-0.085Sc2O3-0.005aluminum 2O3 8.8x10-20.90ZrO2-

0.095Sc2O3-0.005aluminum 2O3 10.3x10-20.89ZrO2-0.105Sc2O3-0.005aluminum 2O3 10.6x10-20.88ZrO2-0.115Sc2O3-0.005aluminum 2O3 8.9x10-20.87ZrO2-0.125Sc2O3-0.005aluminum 2O3 7.2x10-20.86ZrO2-0.135Sc2O3-0.005aluminum 2O3 5.9x10-2 [0040] (Example 5) Drawing 3 is drawing showing the example of a configuration of the solid fuel cell of the single cel which used the ingredient of this invention. For 1, as for a solid electrolyte and 3, in the cell configuration of this example, an oxygen electrode and 2 are [a fuel electrode and 4] interconnectors. nickel-ZrO2 was used for the fuel electrode, and LaCrO3 was used for interconnector for LaMnO3 which doped Sr as an oxygen electrode. The creation approach of a single cel is as follows. LaMnO3 which doped Sr first is roasted to the sintered compact of the ceramics with the usual solid reaction method, and the ceramic thin film of a solid electrolyte is roasted at 1600 degrees C of formation with a doctor blade method on it. In addition, a fuel electrode and interconnector are calcinated and made from 1300 degrees C and 1200 degrees C by the single film sequential laminating forming method, respectively.

[0041] Next, the example of measurement shows the effectiveness of this example. In drawing 3, thickness of an oxygen electrode 1 and the fuel electrode 3 was set to 1mm, thickness of a solid electrolyte 2 was set to 0.1mm, thickness of interconnector was set to 1mm, and the single cel of 20mmphi was formed. The current (current density)-voltage characteristic of the single cel in 800 degrees C of H2-air ambient atmospheres in case the ingredient of a solid electrolyte 2 is 0.88ZrO(s)2-0.115Sc2O3-0.005aluminum 2O3 is shown in drawing 4. It is the property of the conventional example shown for the comparison of the curve by the side of YSZ. Thus, the cell property with this example better than the conventional example, i.e., the current-voltage characteristic, was acquired. When the ingredient of this invention was similarly used as a solid electrolyte, the whole of the cell property was better than the

conventional example.

[0042]

[Effect of the Invention] It has conductivity 4 times the BE **** of this. the oxygen ionic conductor YSZ conventionally used by the device of the 2nd dopant although it was not able to use as an ingredient, since 2OZrO2-Sc3 system was the instability of the crystal structure although it has the highest ionic conductivity by the zirconia system as explained above -- a ratio -- And the mechanical strength to a heat cycle succeeded in obtaining the small ingredient of aging of hot conductivity strongly by stabilizing a cubic to a room temperature structurally. This invention makes a big contribution to low-temperature actuation-ization of a solid fuel cell.
